## Seafoam CHORUS

# Welcome

Thank you for purchasing the Keeley Seafoam Chorus. The Seafoam is a low-noise, digital chorus and pitch vibrato effect. Our chorus provides a nice range of tones from simple doubling, to rotating speaker sounds, to thick and lush spacey sound effects.

### Description of controls:

**RATE:** Controls speed of pitch modulation or chorus effect

**DEPTH:** Controls the amount of modulation or pitch bending. The higher the depth control setting, the wider and more spacious the sound or pitch bending.

**BLEND:** This control blends between a chorus and a vibrato. Go full left for Vibe, full right for Chorus

**TONE:** Controls the treble or high frequencies of the chorus effect, doesn't affect your original guitar's tone

Keeley Electronics

# Suggested Settings

**CHORUS:** RATE and DEPTH set pretty low, the BLEND control set to full right, and the TONE control set to taste. This setting will produce a cool watery chorus sound

**CHORUS:** RATE and DEPTH set moderate to high, BLEND control set full right produces a thick river of luscious chorus, VERY spacey!!

**VIBRATO:** BLEND control set full left, RATE at about 2 o'clock and TONE control set full right, produces a Pitch Vibrato like what's found on vintage amps or some Cajun Swamp!

**Special Note:** Be careful setting the DEPTH control too high if you want to avoid an out-of-tune sound. It only takes a little for the effect to be VERY pronounced.
