

DYNAMIC switch:

The DYNAMIC switch features an electronic circuit which doubles the supply voltage to 18 volts internally. A higher supply voltage results in more headroom, clarity and greater dynamic response. Set the switch to the right to increase headroom and dynamic.

Power:

You have to insert a standard 9 volt DC power adaptor (2.1mm with negative tip) into the dc jack to power up the pedal. Alternatively, you can unscrew the bottom plate and access a 9 volt battery. Note that a connector has to be plugged into the INPUT jack to power the pedal in battery mode. This unit runs off 9 volt DC only, do NOT use adaptors with higher voltages or alternating current (AC).

True bypass:

The ON/OFF and BOOSTER footswitches operate as a true bypass to guarantee best signal quality when unit is in bypass mode.

The PLEXDRIVE uses a 100% pure analog circuit for the audio path.

The PLEXDRIVE is a low gain overdrive. It is highly transparent and dynamic and provides a warm sound such as the legendary Plexi.

You can get two different amounts of gain with the GAIN switch. The maximum amount of gain is comparable to a Plexi with all knobs on ten. So it's possible to get the famous Plexi sound and feeling at low volumes.

With the INPUT, TONE and PRESENCE knobs it's possible to create your own tone by shaping not only the sound but also the overall amount of gain.

The boost function provides a huge volume boost. Although the booster is primarily designed as a clean-boost, it adds some dirt, compression and warmth to the signal at higher settings.

The boost function also works when overdrive is in bypass mode.

OVERVIEW
